

Successful companies run on good data!

How well your company runs depend a lot on how well it can organize and communicate its data. Today, corporations are inundated with information from systems such as CRM, ERP, POS, Inventory and HR. Each system has its own value and purpose. However, each system also comes with its own terminology and differing view as to how the company is operating. Corporations need a system that provides an integrated and comprehensive view as to true state of the corporation. Knowledge Solutions' Data Warehousing services enable corporations to achieve that single version of the truth, to become more aware of operational changes and needs, and to become more efficient in communicating information across the corporation. In addition, Data Warehousing forms the foundation that supports Business Intelligence applications for analysis and reporting, and integrated technology such as mobile devices for information when you need it. Backed by Knowledge Solutions Business Intelligence practice, Data Warehousing provides the lifeblood to help your company run faster and further.

Knowledge Solutions' Data Warehousing services enable corporations to obtain:

- Single version of the truth across disparate corporate systems
- Common Communication and terminology
- Ability to capture, consolidate and mine data
- Access to real-time business information
- A foundation for Business Intelligence and Operational Guidance

Data Warehousing Benefits

Confidence: Ensures customer and company confidence in the completeness and accuracy of information.

Reliability: Backed by proven data warehousing methods, technologies and practices, information presented represents the true nature of the business.

Control: Real-time, consolidated information enables executive feedback and direction.

Enlightenment: Integrates data from various systems for cross-department and in-depth corporate analysis.

Extensibility: Scalable platform that can grow from small to enterprise to meet the needs of expanding businesses.

Security: Data is accessible only to those who have authorization.
